

LEARNING OUTCOMES

FLUTTER ASSIGNMENT 3 – PROFILE CARD UI

Through this assignment, I learned how to create a structured and attractive user interface using Flutter. I gained practical experience in combining different Flutter widgets and styling them according to the requirements.

1. Flutter Widget Structure

I learned how Flutter applications are built by combining widgets. Each widget is responsible for a specific part of the user interface, and multiple widgets can be nested to create a complete screen.

2. Row and Column

I learned how to use Column to arrange widgets vertically and Row to arrange widgets horizontally. These widgets helped me organize the profile information, contact details, statistics, and action buttons.

3. Container and UI Styling

I learned how to use Container for controlling spacing, padding, background colors, borders, rounded corners, and overall layout. This helped me create the main profile card and different sections of the UI.

4. CircleAvatar and Icons

I learned how to use CircleAvatar to create a profile image area and Icon widgets to represent information such as location, email, phone, profile, and actions.

5. Text Styling

I learned how to customize text using different font sizes, weights, and colors to create a clear visual hierarchy between headings, descriptions, and other information.

6. Custom Theme and Colors

I learned how to apply custom colors and themes instead of relying only on Flutter's default styling. A purple-based theme and gradient-style header were used to give the application a consistent appearance.

7. Responsive UI Design

I learned how to arrange UI elements so that the profile card remains properly organized across different screen sizes. Proper spacing, alignment, and sizing were important for achieving a clean layout.

8. Basic Interactivity

I learned how Flutter widgets can respond to user actions. Features such as the theme toggle, Follow button, and Message button helped me understand the basics of interactive UI development.

9. UI/UX Design

I learned that good UI is not only about placing widgets on the screen. Proper spacing, alignment, colors, typography, shadows, rounded corners, and visual hierarchy are important for creating a better user experience.

10. Testing Flutter Applications

I also learned how to run and test a Flutter application using Flutter Web and Google Chrome and verify that the UI and interactive elements work correctly.

CONCLUSION

This assignment helped me understand the fundamentals of Flutter UI development. I learned how to combine widgets, manage layouts, apply styling and themes, and add basic interactions. These concepts will be useful for building more complex and professional Flutter applications in future assignments and projects.
